Estimaciones de población de departamentos por sexo y grupos de edad

Años 2010-2025. Provincia de Santa Fe

Presentación

La información estadística que brindan las proyecciones de población constituye una herramienta fundamental para la planificación de políticas públicas de corto, mediano y largo plazo; y es de vital importancia para el sector privado y los investigadores.

Además, permite estimar la demanda potencial de bienes y servicios en distintas áreas como Salud, Educación, Trabajo, Seguridad Social, entre otras; y evaluar los recursos necesarios para satisfacer esas demandas, entre las que se encuentran la disponibilidad de hospitales, camas y vacunas; escuelas, aulas, etc.

Nuestro agradecimiento a INDEC por sus sugerencias para la elaboración del presente trabajo.

PRIMERA PARTE

Informe técnico

1. Introducción

El presente informe presenta las estimaciones de población de los departamentos de la provincia de Santa Fe desagregadas por grupos quinquenales de edad y sexo para el período 2010-2025, calculadas a partir de las proyecciones difundidas por el INDEC en las publicaciones “Proyecciones provinciales de población por sexo y grupos de edad, 2010-2040. Serie de análisis demográficos N° 36” y “Estimaciones de población por sexo, departamento y año calendario 2010-2025. Serie de análisis demográfico N° 38”. El principal objetivo es dar cuenta de los cambios ocurridos en la evolución de la población para ese período y nivel de desagregación.

Debe considerarse que la elaboración de proyecciones de población de áreas menores, como es departamentos en este trabajo, resulta compleja debido a la imposibilidad de aplicar un método estrictamente demográfico, tal como el método de los componentes, que requiere la estimación y proyección independiente de cada una de las variables del crecimiento de la población (fecundidad, mortalidad y migraciones). A este nivel de desagregación, los hechos vitales presentan fluctuaciones anuales más acentuadas cuanto menor es el número de población y consecuentemente de nacimientos y defunciones, que pueden afectar las estimaciones de la fecundidad y la mortalidad. Asimismo, el mayor obstáculo se encuentra en la determinación de la migración interna, que suele ser un elemento muy importante del crecimiento de dichas áreas. Esto se debe a la dificultad de obtener estimaciones de saldos migratorios consistentes a nivel departamental y de localidad y a la complejidad para su proyección futura, por tratarse de un factor estrechamente asociado a las condiciones económicas y sociales del momento. En consecuencia, las estimaciones realizadas en este trabajo, deben ser utilizadas con prudencia, teniendo en cuenta que no están consideradas las variables del crecimiento poblacional.

2. Metodología aplicada

El crecimiento de la población observado a través de los censos históricos, pone en evidencia las diferencias geográficas que existen en la dinámica poblacional argentina, las cuales se vuelven más notorias cuando se avanza en la desagregación espacial. Considerando este comportamiento heterogéneo, resulta conveniente utilizar diversas metodologías para proyectar la población de áreas que se encuentran en diferentes situaciones

Finalmente, para desagregar la proyección de los departamentos por grupos quinquenales de edad y sexo, se utiliza la técnica de la Tabla Cuadrada. Mediante la misma, es posible disponer, para una fecha dada, de información acerca de la población de dos o más áreas menores por grupos de edad, acordes con la distribución por grupos de edad del área mayor y de totales proyectados para cada una de las áreas menores.

Se utilizaron las proyecciones provinciales por sexo y grupos quinquenales de edad (1) y las proyecciones de los departamentos por sexo (2). Ambas comprenden el período 2010-2025.
